Methodology and Evidence Notes

The suspicious-activity section is produced by scanning extracted UFDR record text for configured review terms such as suspicious, threat, malware, deleted, recovered, urgent, unknown, password, phishing, and fraud. Only records belonging to the selected Case ID are considered. No default or sample forensic records are inserted.

These indicators are triage leads for investigator review. They should be validated against the underlying UFDR evidence and the original forensic examination context before being treated as findings.

Case/report separation: every included record retains its case_id and report_id so evidence is traceable to its source report.
